RETAIL SALES DASHBOARD

PROJECT REPORT

Prepared using Microsoft Power BI Desktop

Submitted by

Chandni

1. Introduction

The Retail Sales Dashboard presents an overview of sales performance across products, stores, cities and customer segments. It brings key performance indicators and interactive visual analysis together in Microsoft Power BI to support the review of revenue, profit, orders and quantity.

2. Objectives

• Monitor total revenue, total profit, total orders and total quantity.

• Compare revenue and profit across product categories.

• Analyze revenue contribution by store type.

• Review revenue trends over time and compare performance across cities and stores.

• Filter results by year, store type, product category, state and customer segment.

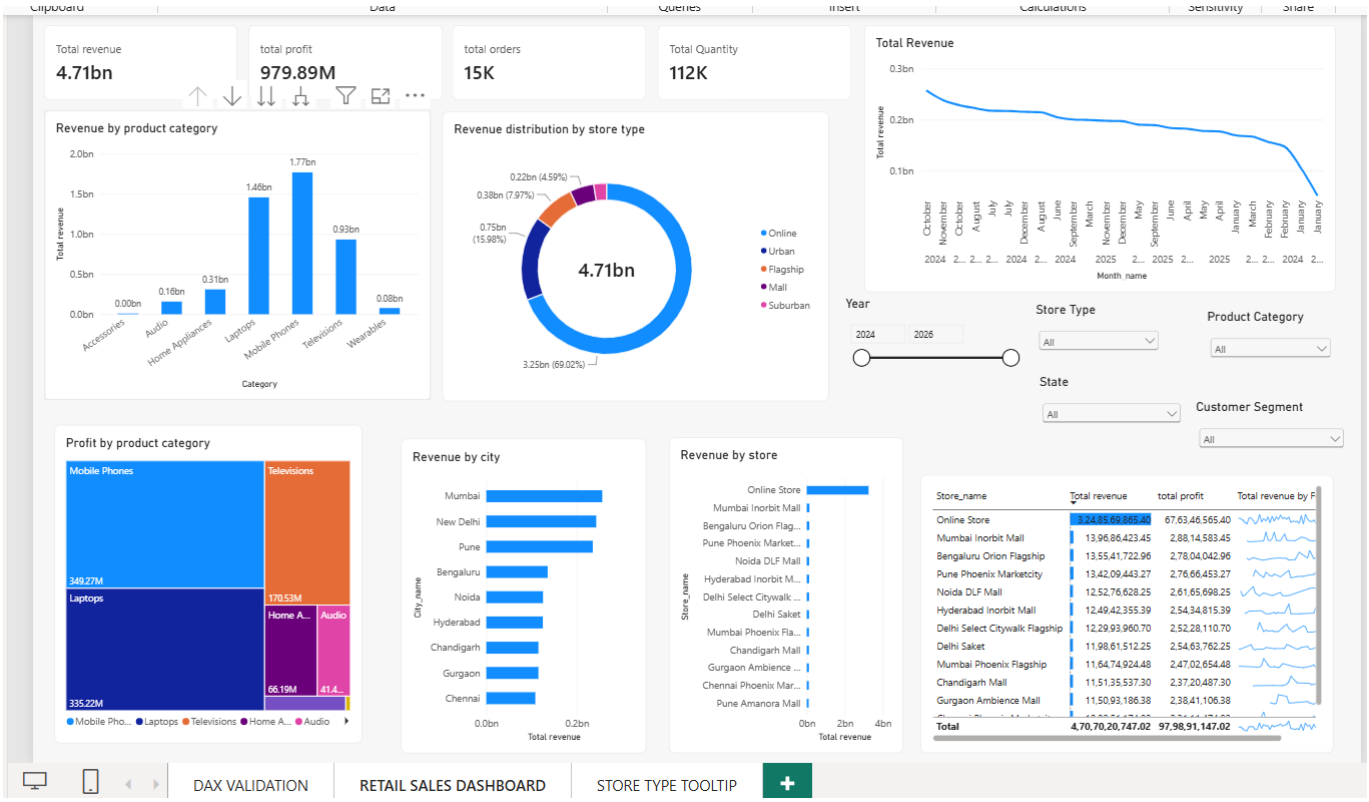

• Validate key DAX measures and review store-level performance.

3. Dataset Description

The data model contains retail sales information associated with products, dates, stores, locations and customers. Fields used in the report include category, subcategory, store_type, store_name, city_name, state, customer_segment and full_date, together with sales and profit measures.

4. Dashboard Overview

The Retail Sales Dashboard contains four KPI cards, six analytical charts, five slicers and a Store Performance table. The visuals present product-category revenue, product-category profit, store-type revenue distribution, monthly revenue trend, revenue by city and revenue by store.

5. KPI Cards and Headline Metrics

Metric	Value	Description
Total Revenue	$4.71bn	Aggregate revenue.
Total Profit	$979.89M	Aggregate profit.
Total Orders	15K	Total order count.
Total Quantity	112K	Total quantity sold.

6. Revenue by Product Category

The column chart compares revenue across Accessories, Audio, Home Appliances, Laptops, Mobile Phones, Televisions and Wearables. Mobile Phones leads at approximately $1.77bn, followed by Laptops at $1.46bn and Televisions at $0.93bn. Home Appliances, Audio and Wearables contribute smaller amounts.

7. Profit by Product Category

The treemap compares profit across product categories. Mobile Phones and Laptops are the largest contributors, with displayed values of approximately $349.27M and $335.22M. Televisions contributes approximately $170.53M, followed by Home Appliances at approximately $66.19M. Audio, Wearables and Accessories contribute smaller amounts.

8. Revenue Distribution by Store Type

Online is the largest store-type contributor, with approximately $3.25bn (69.02%) of revenue. Urban contributes approximately $0.75bn (15.98%), Flagship approximately $0.38bn (7.97%), Mall approximately $0.22bn (4.59%) and Suburban approximately $0.12bn (2.45%).

9. Monthly Revenue Trend

The line chart displays total revenue across the month sequence. The plotted line generally declines across the visible sequence, with smaller fluctuations and a sharper drop at the end. The month labels should be checked for chronological sorting in Power BI before interpreting the trend.

10. Revenue by City

The horizontal bar chart compares revenue across cities. Mumbai has the longest bar, followed by New Delhi and Pune. Bengaluru, Noida, Hyderabad, Chandigarh, Gurgaon and Chennai appear below these cities.

11. Revenue by Store

The store-level bar chart compares revenue across individual stores. Online Store has a substantially longer bar than the other displayed stores. The remaining stores have comparatively smaller bars at the chart scale.

12. Filters and Interactivity

• Year — range selection from 2024 to 2026.

• Store Type — Flagship, Mall, Online, Suburban and Urban.

• Product Category — Accessories, Audio, Home Appliances, Laptops, Mobile Phones, Televisions and Wearables.

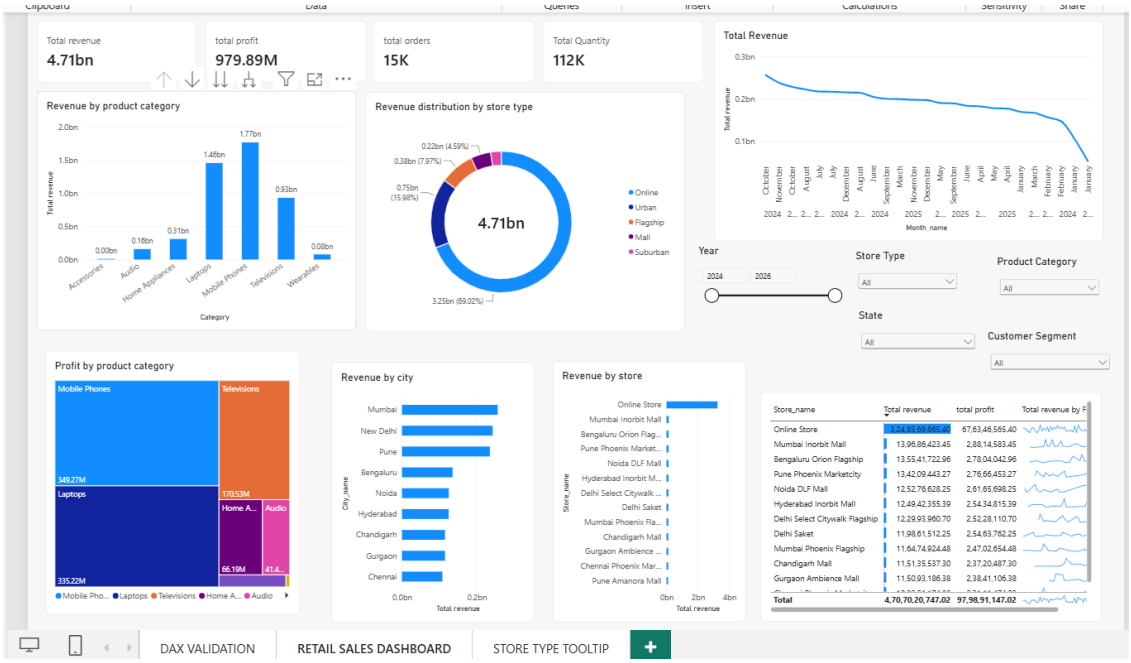

• State — dropdown selection.

• Customer Segment — Premium, Occasional, Regular and Value.

The slicers allow dashboard results to be narrowed by the selected year, store type, product category, state and customer segment.

13. Store Performance

The Store Performance table lists store names with Total Revenue and Total Profit. It also includes a revenue sparkline for each store across the date field. Revenue values are emphasized with data bars, allowing stores to be compared within the same table.

14. DAX Validation

The DAX Validation page displays the following measures:

• Total Quantity: 112,353

• Total Revenue: 4,70,70,20,747.02

• Total Cost: 3,72,71,29,600

• Total Profit: 97,98,91,147.02

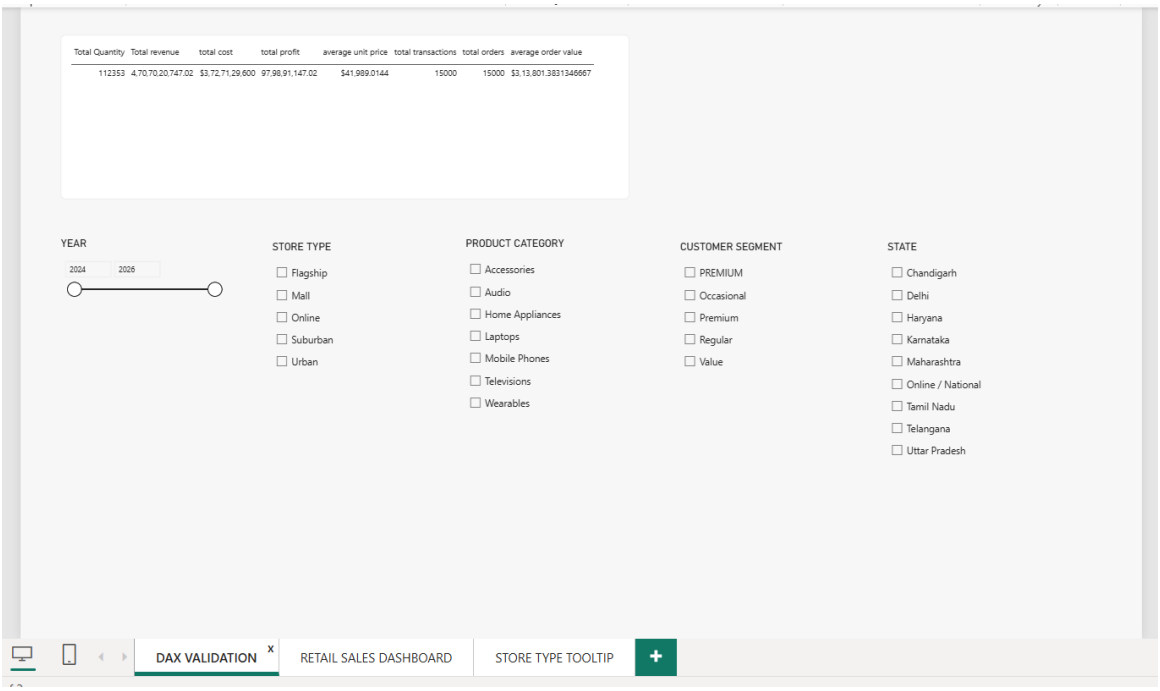

• Average Unit Price: $41,989.0144

• Total Transactions: 15,000

• Total Orders: 15,000

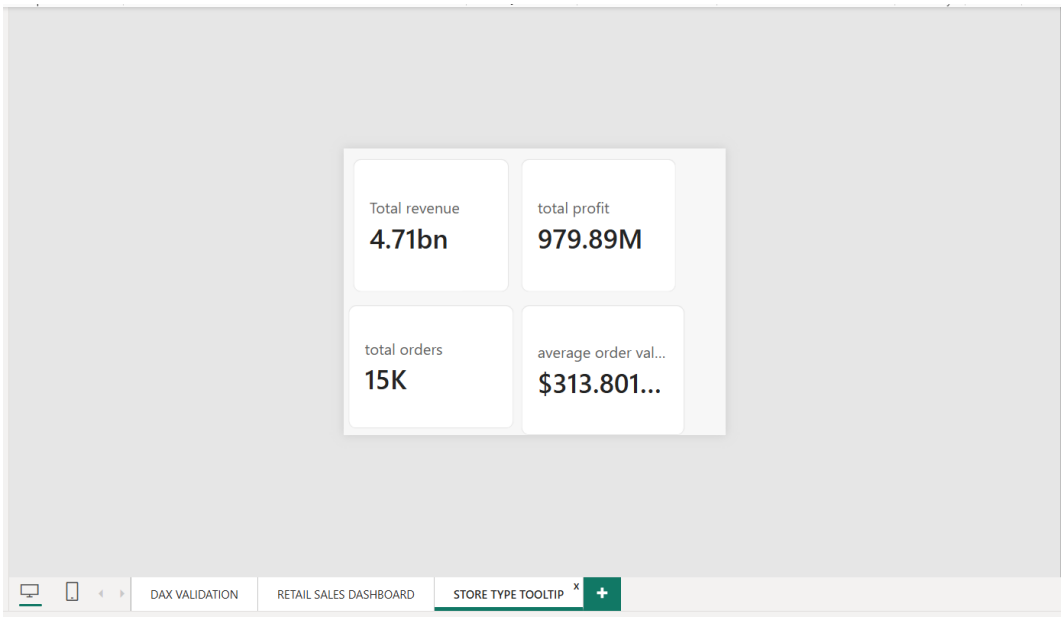

• Average Order Value: $3,13,801.3831

The page also contains slicers for Year, Store Type, Product Category, Customer Segment and State to support checking how the measures respond to filter selections.

15. Store Type Tooltip

The Store Type Tooltip page contains four KPI cards: Total Revenue (4.71bn), Total Profit (979.89M), Total Orders (15K) and Average Order Value (approximately $313.801K).

16. Key Findings

• Total revenue is displayed as $4.71bn and total profit as $979.89M.

• The dashboard displays 15K total orders and 112K total quantity.

• Mobile Phones is the leading category by revenue.

• Mobile Phones and Laptops are the largest profit contributors in the treemap.

• Online stores contribute approximately 69.02% of revenue.

• Mumbai has the highest displayed revenue among the cities shown.

• Online Store has the largest revenue bar among the displayed stores.

17. Conclusion

The Retail Sales Dashboard brings together headline sales measures and analysis by product category, store type, month, city and store. KPI cards provide a quick summary of revenue, profit, orders and quantity. Charts and slicers support comparisons across the business, while the Store Performance table, DAX Validation page and Store Type Tooltip provide additional detail for reviewing results.
